 $\verb"enum" spinAutoExposureControlPriorityEnums"$

< Selects whether to adjust gain or exposure first. When gain priority is selected, the camera fixes the gain to 0 dB, and the exposure is adjusted according to the target grey level. If the maximum exposure is reached before the target grey level is hit, the gain starts to change to meet the target. This mode is used to have the minimum noise. When exposure priority is selected, the camera sets the exposure to a small value (default is 5 ms). The gain is adjusted according to the target grey level. If maximum gain is reached before the target grey level is hit, the exposure starts to change to meet the target. This mode is used to capture fast motion.</p>

ImageComponentSelector_Range	The acquisition of range (distance) data is controlled. The data produced may be only range (2.5D) or a point cloud 3D coordinates depending on the Scan3dControl.
ImageComponentSelector_Disparity	The acquisition of stereo camera disparity data is controlled. Disparity is a more specific range format approximately inversely proportional to distance. Disparity is typically given in pixel units.
ImageComponentSelector_Confidence	The acquisition of confidence map of the acquired image is controlled. Confidence data may be binary (0 - invalid) or an integer where 0 is invalid and increasing value is increased confidence in the data in the corresponding pixel. If floating point representation is used the confidence image is normalized to the range [0,1], for integer representation the maximum possible integer represents maximum confidence.

4.38.1 Detailed Description

The functions in this section provide access to video recording capabilities, which include opening, building, and closing video files.

4.38.2 Function Documentation

4.38.2.1 spinVideoAppend()

4.38.2.2 spinVideoClose()

4.38.2.3 spinVideoOpenH264()

4.38.2.4 spinVideoOpenMJPG()

4.38.2.5 spinVideoOpenUncompressed()

4.38.2.6 spinVideoSetMaximumFileSize()

Set the maximum file size (in megabytes) of a AVI/MP4 file.

A new AVI/MP4 file is created automatically when file size limit is reached. Setting a maximum size of 0 indicates no limit on file size.

Parameters

hSpinVideo The spin v		The spin video recorder to append the image to
	size	The maximum video file size in MB.

Returns

spinError The error code; returns SPINNAKER_ERR_SUCCESS (or 0) for no error

4.39.2.12 spinTLStreamBufferHandlingModeEnums

 $\verb"enum" spinTLStreamBufferHandlingModeEnums"$

< Available buffer handling modes of this data stream:

StreamBufferHandlingMode_OldestFirst	The application always gets the buffer from the head of the output buffer queue (thus, the oldest available one). If the output buffer queue is empty, the application waits for a newly acquired buffer until the timeout expires.
StreamBufferHandlingMode_OldestFirstOverwrite	The application always gets the buffer from the head of the output buffer queue (thus, the oldest available one). If the output buffer queue is empty, the application waits for a newly acquired buffer until the timeout expires. If a new buffer arrives it will overwrite the existing buffer from the head of the queue (behaves like a circular buffer).

Enumerator

StreamBufferHandlingMode_NewestOnly	The application always gets the latest completed buffer (the newest one). If the Output Buffer Queue is empty, the application waits for a newly acquired buffer until the timeout expires. This buffer handling mode is typically used in a live display GUI where it is important that there is no lag between camera and display.
StreamBufferHandlingMode_NewestFirst	The application always gets the buffer from the tail of the output buffer queue (thus, the newest available one). If the output buffer queue is empty, the application waits for a newly acquired buffer until the timeout expires.
